Beth,

I talked to Walt this morning on what they accomplished over the week-end.

Walt says they cleaned out the ditch and extended the pad underdrain lines. All the soil test pits have been dug and they have the mister lines set up and running in the overflow pond. There is a total of 72 misters, 32 in the preg pond and 40 in the overflow.(approx.) The present pump they have, to pump the solution back to the preg pond, is to small so he said that they would be buying another one so it would keep up when the sprays in the overflow pond are running. Presently they have about a foot of water in the overflow pond which they are working on pumping back.

The sprays in the overflow pond are presently shut down because the solution level in the preg pond is to low to run both sets of mister lines. There has been no solution being pumped to the pad since they set up the lines in the overflow.

I told him that I planned to stop by the site on Wednesday, August 2nd to check out the soil pits and the vegetation in the application area, because Lynn (our biologist) will be with me. I have to make a run to the Drum mine and we have to drive past the site, so we'll kill two birds with one stone and get both sites done the same day.

Walt also wanted to get a clearance on the ditch so he can start making plans to get the gravel and ADS pipe into the ditch and buried before anything happens to fill it in again. We'll also look at that and make a decision.

He said that they looked under the plastic like I suggested and couldn't see any large amounts of water under the liner. If that is the case, I can't see where there can be any holes of any consequence in the ditch above those areas. As long as you don't have a problem with it I will authorize them to put the ADS into the ditch along with the gravel base. Let me know before Wednesday and I'll let him know how to proceed.

Have a good week, see you next Friday (or sooner if anything else comes up)
Doug

Joelle
